## Geometry: Locus of Points

Notes, Examples, and Practice Quiz (with Solutions)

Topics include circles, equidistance theorem, compound locus of points, intersections, and more.

## Locus of Points: Describing and Graphing

What is a locus of points? "The set of points that satisfies a given condition(s)"
A popular example is a circle. Every point on a circle is equidistant from the center.

The locus of points is " 3 units from $(5,4)$ ".

$$
(x-5)^{2}+(y-4)^{2}=9
$$

note: radius is 3 units

An approach: Keeping in mind, the distance between 2 points is a straight line, sketch points and find the pattern.

Example: Describe all points that are 3 units from $\mathrm{y}=4$
After plotting a few points that are 3 units from points on $\mathrm{y}=3$, a pattern emerges..

Then, plot a few points above $\mathrm{y}=3 \ldots$

Finally, describe the graph.

In this case,
$y=7$ and $y=1$
is the locus of points
3 units from $y=4$

## Locus of Points: Describing and Graphing

An approach: Use geometry properties
Example: Find the locus of points equidistant from $(6,1)$ and $(2,-3)$

We know the midpoint of the $(6,1)$ and $(2,-3)$ is equidistant.

So, how do we find the other points?
Consider the Equidistance Theorem:
If a point is on the perpendicular bisector of a segment, then it is equidistant from the endpoints of the segment.

Find the perpendicular bisector:
Midpoint: $(4,-1)$
Slope: Since slope of given points is $\frac{(-3-1)}{(2-6)}=1$, the slope of $\perp$ bisector is -1

$x+y=3$ is the locus of points equidistant from $(6,1)$ and $(2,-3)$

Example: Draw the locus of points 3 units from $(4,4)$
Definition of a circle: A locus of points that are a fixed distance from a given point.

Since we have a given point $(4,4)$, the locus of points will be a circle.

Plotting $(1,4)(7,4)(4,1)$ and $(4,7)$ will outline the circle...

The equation is $(x-4)^{2}+(y-4)^{2}=9$

$$
(x+h)^{2}+(y+k)^{2}+r^{2}
$$

circle with center ( $\mathrm{h}, \mathrm{k}$ ) and radius length r

## Sketching Locus of Points

Example: Sketch all points that are 2 units from line segment $\overline{\mathrm{AB}}$

The (shortest) distance from a point to a line (segment) is a perpendicular straight line (segment).

And, the shortest distance between 2 points is a straight line.

Example: Describe and graph the locus of points 2 units from $x^{2}+y^{2}=16$

Since the radius of the given circle is 4 ,
we could describe and graph a circle with a radius of $6 \ldots$.

$$
x^{2}+y^{2}=36
$$

Then, we also must describe and graph a circle with a radius of $2 \ldots$.

$$
x^{2}+y^{2}=4
$$

Example: Sketch all points that are 2 units from line segment $\overline{\mathrm{AB}}$
Answer 1: Any point where the (minimum) distance to the segment is exactly 2 units.

Every point on the track is 2 units from the nearest point on the segment.
(note: in Euclidean Geometry, the distance from a point to a line is the shortest distance possible.)

Answer 2: Any point that is exactly 2 units from anywhere on the line segment.

Every point in the shaded area
is 2 units from some point on the segment.

Answers 3 and 4: $\overline{\mathrm{AB}}$ is in 3-dimensional space (instead of a 2-d plane)
In space, the locus of points 2 units from $\overline{\mathrm{AB}}$ could be
a "hollow pill"
or, a "solid pill"...

Example: Find the locus of points that are 3 units from $(4,5)$ and 2 units from $\mathrm{x}=8$.
Step 1: Find the locus of points that are 3 units from $(4,5) \ldots$

$$
\text { The circle }(x-4)^{2}+(y-5)^{2}=9
$$

Step 2: Find the locus of points that are 2 units from $x=8 \ldots$

$$
\text { The lines } x=6 \text { and } x=10
$$

Step 3: Identify any intersecting points...
To find the values, solve the system:

$$
\begin{aligned}
& x=6 \\
& (x-4)^{2}+(y-5)^{2}=9
\end{aligned}
$$

Direct substitution:

$$
x=6
$$

$$
\begin{array}{r}
(6-4)^{2}+(y-5)^{2}=9 \\
(y-5)^{2}=5 \\
6 \quad y=5 \pm \sqrt{5}
\end{array}
$$

the locus of points are $(6,5+\sqrt{5})$ and $(6,5-\sqrt{5})$

Example: Identify the locus of point 3 units from $\overline{\mathrm{FG}}$ and 2 units from $\overline{\mathrm{PQ}}$

Step 1: Draw a race track oval around $\overline{\mathrm{FG}}$
Step 2: Draw a race track oval around $\overline{\mathrm{PQ}}$
Step 3: Identify the points of intersection

The locus of points both 3 units from $\overline{\mathrm{FG}}$ and 2 units from $\overline{\mathrm{PQ}}$ are $(7,3)$ and $(7,7)$

Example: Can you find the locus of points that are 1 unit from a 4 -unit line segment AND

First locus of points

Second locus of points

These 4 points are
2 units from the segment AND 4 units from the midpoint of the segment.

Example: Describe the locus of points that are
a) 6 units from $A$ and $B$
b) 4 units from $A$ and $B$
c) 10 units from A and B

a) 6 units from both A and B : a line

c) 10 units from $A$ and $B$

In a 2-dimensional plane, there is no intersections. Empty set (i.e. no solutions)
BUT, in 3-dimensional space, the locus of points is in a line 'above' A and B and a line 'below' A and B
(note: line A, line B, and the line above (or below) would form the edges of an isosceles triangular prism with base 12 , sides 10 , and height 8 )
b) 4 units from both A and B: Empty set

line 'above'
$A$ and $B$
 (above lines A and B)

Example: Describe the locus of points that are 4 units from the ray $\overrightarrow{\mathrm{AB}}$

Two parallel rays that are 4 units from $A B$...

And, a semicircle whose center is A and radius is 4

## Example: Buried treasure

Definition of Locus:

- A place;
- A place where something happens;
- A center of great activity...

The latin word 'locus' means "place"
The plural 'loci' means "places"

## Topic for Discussion- $\rightarrow$

## A topic of discussion: Locus of points equidistant from 2 rays (with same endpoint)

Here are 2 potential answers:

OR , is there another possible answer?!?!?
(3)

Describe and graph the locus of points equidistant from 2 rays that form a 90 degree angle:

A topic of discussion: Locus of points equidistant from 2 rays (with same endpoint)
Drawing a conclusion by using a compound locus of points....
Describe and graph the locus of points equidistant from 2 rays that form an angle

First, draw 2 locus of points -- each 2 units from each ray

Locus of points that are 2 units from $\overrightarrow{A B}$
Locus of points that are 2 units from $\overrightarrow{\mathrm{AC}}$

The green represents the intersection, showing the compound locus of points
(i.e. points that are 2 units from BOTH rays!)

Then, add locus points that is 3 units from each ray...

The green points and arcs represent any point that is 2 or 3 units from both of the rays...

Finally, add locus of points that are x units from each ray....

Practice Quizzes (and Solutions) - $\rightarrow$

1) All points 6 units from the origin
2) All points 3 units from $y=-2$
3) All points equidistant from the ( $x$ and $y$ ) axes
4) All points equidistant from $(2,4)$ and $(0,2)$

Describe the compound locus of points. Also, draw a quick sketch...

1) Locus of points equidistant from 2 concentric circles
2) Midpoint of all chords that are congruent to a given chord in a circle
3) (In a plane), the locus of points 3 units from point C and 5 units from point D
4) Equidistant from 2 points AND lying on the same circle
5) 6 units from two (non-parallel) lines

6) Describe the locus of points that are 4 units from a circle with radius 4 .
7) Describe the locus of points 7 units from ray $\overrightarrow{\mathrm{AB}}$ and 7 units from point B
8) Describe the locus of points 7 units from ray AB and 7 units from point A

Describe the following. Then, draw a sketch.

1) Locus of points 6 inches from a line that lie on a circle with a 10 -inch radius that has endpoint on the line
2) Locus of points that are equidistant from $(3,7)$ and $(7,5)$
3) All points that are 2 units from ray $\overrightarrow{\mathrm{AB}}$
4) A goat is tied to a fence post in an open pasture. If the rope is 20 feet long, describe the area it is free to graze and roam through.
5) All points 6 units from the origin

$$
\begin{aligned}
& \text { Circle with center } \\
& \text { at }(0,0) \\
& \text { and radius } 6 \\
& x^{2}+y^{2}=36
\end{aligned}
$$

2) All points 3 units from $y=-2$

$$
\text { the lines } \begin{aligned}
y & =1 \text { and } \\
y & =-5
\end{aligned}
$$

3) All points equidistant from the ( $x$ and $y$ ) axes

$$
\begin{aligned}
& \text { All points on } \\
& \qquad \begin{array}{l}
y=x \\
\text { or } \\
y=-x
\end{array}
\end{aligned}
$$

4) All points equidistant from $(2,4)$ and $(0,2)$
find midpoint: $(1,3)$
then, construct line
that is perpendicular to the
segment that joins $(2,4)$ and $(0,2)$
and goes through the midpoint $(1,3)$

$$
y=-x+4
$$

Describe the compound locus of points. Also, draw a quick sketch...

1) Locus of points equidistant from 2 concentric circles

A (concentric) circle in between ex: if the radii of concentric circles is 6 and 10 , then radius of circle from locus of points is $8 \ldots$
2) Midpoint of all chords that are congruent to a given chord in a circle

3) (In a plane), the locus of points 3 units from point $C$ and 5 units from point D

Case 1: No points exist...

Case 2: 1 point

4) Equidistant from 2 points AND lying on the same circle

Case 1: 1 point

Case 2: 2 points
5) 6 units from two (non-parallel) lines

6) Describe the locus of points that are 4 units from a circle with radius 4 .

Step 1: Draw the circle

Step 3: Describe

It's a circle with radius 8 AND the center point

## Step 2: Consider the locus of points

7) Describe the locus of points 7 units from ray $\overrightarrow{\mathrm{AB}}$ and 7 units from point B

Two points: 7 units above and 7 units below B

$\rightarrow$
8) Describe the locus of points 7 units from ray AB and 7 units from point A

Semicircle with radius of 7 around left of A

1) Locus of points 6 inches from a line that lie on a circle with a 10 -inch radius that has endpoint on the line
```
vertices of a rectangle that is }12\times1
```

2) Locus of points that are equidistant from $(3,7)$ and $(7,5)$
slope between two points: $\frac{7-5}{3-7}=-1 / 2$
locus of points is the perpendicular bisector..
slope is 2 , and it goes through the midpoint

$$
(5,6)
$$

Note: This question utilizes several geometry topics midpoint
slope of perpendicular lines
equidistant theorem
equation of lines
3) All points that are 2 units from ray $\overrightarrow{\mathrm{AB}}$

$$
\text { semicircle with center } \mathrm{A} \text { and radius } 2
$$

4) A goat is tied to a fence post in an open pasture. If the rope is 20 feet long, describe the area it is free to graze and roam through.

The locus of points is a circle with radius 20, and all the point inside the circle!
Total area $=\pi$ (radius) $^{2}=400 \pi$ square ft
